Auto Ticket Classification using Flow Designer

PHASE 1: Requirement Analysis & Planning

Project Overview

The school IT helpdesk receives support requests from students and teachers for network connectivity, hardware failures, account access, and system performance. Manual review and classification take time and may cause inconsistent categorization.

Objective

Define the requirements and prepare a dedicated Update Set so the project configuration can be organized and transferred.

Skills

Requirement analysis • ServiceNow navigation • Local Update Sets • Configuration planning

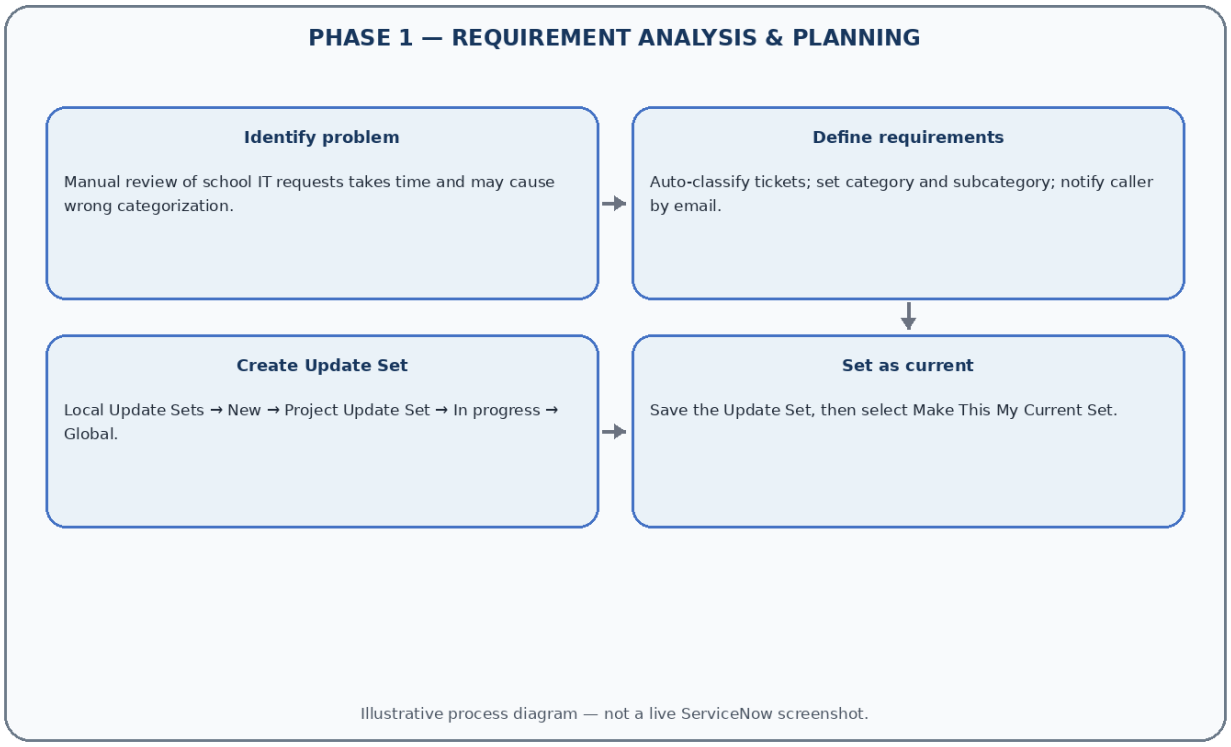

Figure: Illustrative process diagram. It is not a captured ServiceNow screen.

Activity 1: Business Use Case

The system must automatically classify IT tickets from the issue description.

Category and Subcategory should be assigned without manual intervention.

Subcategory choices should depend on the selected Category.

An automated email should be sent to the caller when a ticket is created.

Ticket information must be stored in a structured format that is maintainable and scalable.

Activity 2: Creation of New Update Set

1. Open All menus and search for Update Sets.

2. Under System Update Sets, select Local Update Sets.

3. Click New.

4. Enter Name: Project Update Set.

5. Set State: In progress.

6. Set Application: Global.

7. Save the form.

8. Under Related Links, click Make This My Current Set.

9. Confirm that Project Update Set appears as the current Update Set.

Activity 3: Planning Summary

Ticket categories: Network, Hardware, Access, Performance.

Subcategories: Wi-Fi, Projector, Forgot Password, Slow Computer.

Automation: classify tickets from keywords in Short Description and send an email to the caller.
