Auto Ticket Classification using Flow Designer

PHASE 4: Testing, Validation & Security

Project Overview

Testing confirms that the table, classification logic, and email notification behave as expected. Validation also checks the accuracy of field values and basic access control.

Objective

Verify end-to-end ticket classification, ensure field values are stored correctly, and confirm that email notifications are generated.

Skills

Functional testing • Data validation • Email verification • Security review

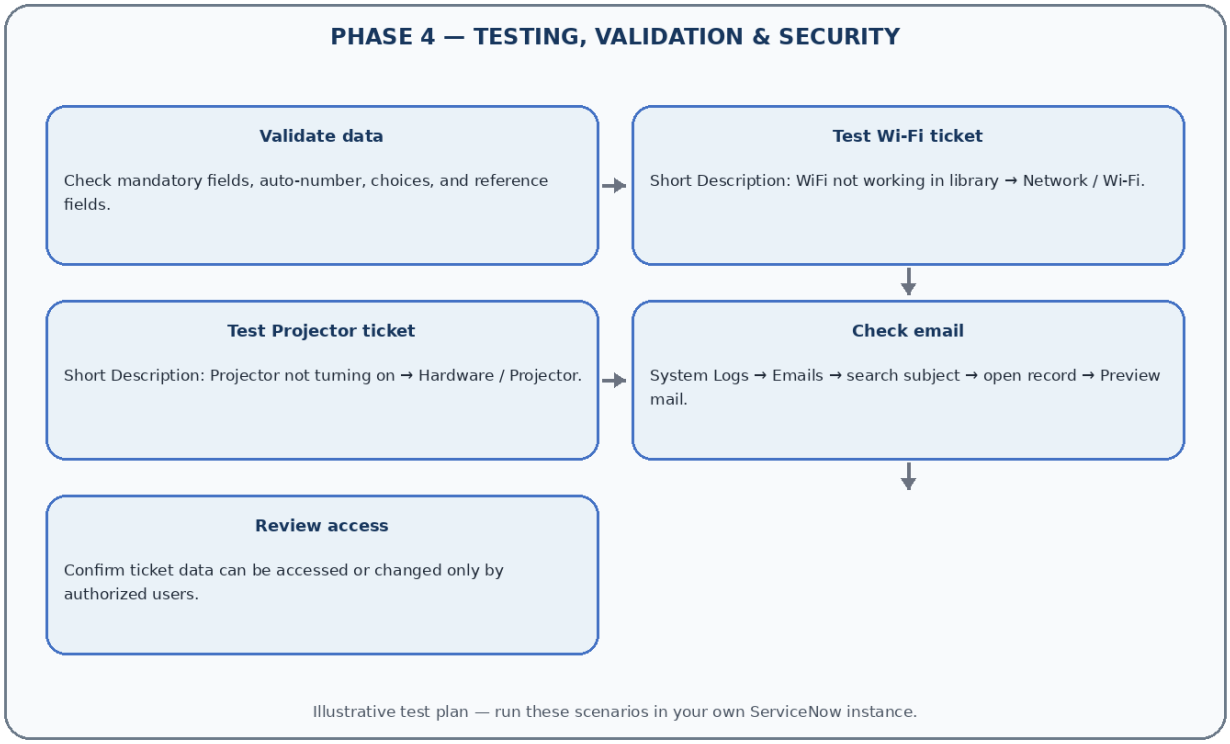

Figure: Illustrative process diagram. It is not a captured ServiceNow screen.

Activity 1: Data Validation Checks

Confirm mandatory fields are captured correctly.

Confirm the auto-number is generated without duplication.

Check that Category and Subcategory values are stored accurately.

Check that Caller, Assigned Group, and Assigned to reference fields resolve correctly.

Activity 2: Test Scenario 1 — Wi-Fi

1. Create a ticket and enter a Caller Name.
2. Short Description: WiFi not working in library.
3. Save and reload the form.

4. Expected result: Category = Network; Subcategory = Wi-Fi.

5. Verify that an email is sent to the caller’s email address.

Activity 3: Check Email Notification

1. Open All menus and search for Emails.

2. Under System Logs, select Emails.

3. Search for the configured subject.

4. Open the email record and choose Preview mail under Related Links.

Activity 4: Test Scenario 2 — Projector

1. Create a ticket and enter a Caller Name.

2. Short Description: Projector not turning on.

3. Save and reload the form.

4. Expected result: Category = Hardware; Subcategory = Projector.

5. Verify that an email is sent to the caller.
